0:06

so now the question what is the reason

0:10

what causes the caption contraction body

0:13

usually an implant should be sterile but

0:17

after a while little bacteria can settle

0:21

on the surface of the implant and then

0:24

this is so called biofilm and the body

0:28

starts to encapsulate the ink implants

0:33

in order to protect itself against this

0:36

biofilm of bacteria a good sign of a

0:40

good a symbol of it all

0:43

he is a crystal clear little river in

0:48

the mountains the water is more less

0:50

sterile it's the same like our drinking

0:53

water and the Thames here but if you

0:56

step in it you will feel that under

0:59

little stones and pebbles in there it is

1:02

glibbery and on the surface of those

1:05

stones you find a lot of biofilms

1:08

innocent and kind of covered

1:12

with bacteria and with algae and other

1:15

things and this is same with the implant

1:18

it is only on the implant it's not in

1:21

surrounding liquid it does migrate

1:23

into the body

1:24

for the body forms the capsule to

1:27

protect itself
