0:06

many patients after they received

0:09

silicone implants start to suffer from

0:13

capsular contracture one day so once

0:15

again so contraction you must imagine

0:17

that the soft round implant is

0:23

encapsulated with their body's own

0:26

tissue and when the body feels

0:29

that the implant is not really healthy

0:32

anymore

0:33

there's capsular tissue will start

0:37

shrinking and then the soft implant will

0:41

feel round and heart like a stone the same

0:45

system if you have a balloon if you

0:48

inflate the balloon it will be very very

0:50

hard if you take out the air it's just a

0:54

very soft little shell left and as the

0:58

saying goes it has a contraction usually

1:00

the capsules are not very hard and not

1:02

very thick
